

Intense pulse light and Excel V lasers

IPL

IPL (intense pulsed light) technology can treat a wide range of facial concerns such as facial veins, skin discolouration, freckles, age spots and features of rosacea.

IPL treatments can cause a stinging or burning sensation on the skin. Redness at the treatment sites may last for 1-2 days. Skin discolouration will become temporarily darker and then will fade to a lighter shade within 7-10 days. Swelling can occur and last up to 48 hours. Treatment time is normally about 30 minutes. No numbing is required.

A series of treatments is recommended for maximum improvement. You should always allow 2 weeks before any important social functions. After treatment, sun protection and gentle skin care is advised.

Fees* (1/series of 3)	Face \$450/1200
	Neck \$250/650
	Chest 400/1000

Yag Laser

Yag laser is specifically used for the treatment of spider veins. The treatment sensation is warm.

After treatment, the veins may have a scratch-like appearance. Occasionally crusting, darkening, or redness

and bruising can occur. Reactions resolve in 1-2 weeks. Touch-ups are often required. After treatment, sun protection and gentle skin care is advised.

Fees* \$150 - \$350 for 1 – 3 Spots

\$450 for Group Session

Excel V+ laser

This laser treats benign vascular, cutaneous and pigmented lesions by selectively targeting hemoglobin and melanin without causing heat damage to surrounding tissue.

Benign vascular lesion treatments: laser energy is absorbed by hemoglobin in the veins, and the heat causes photocoagulation. Heat is transferred to the vessel wall, which ultimately destroys the vessels. New veins may appear due to an underlying disorder.

Benign pigmented lesion treatments: laser energy is absorbed by superficial pigment in the lesion. Pigmented cells are denatured, darken, rise to the surface, and flake off over a few weeks.

Uneven skin texture, pore size reduction, diffuse redness, and fine wrinkles can be improved with Laser Genesis V. This is a non-ablative (no surface skin damage) treatment of gentle heating of epidermis and dermis. It is an innovative therapy that promotes vibrant and healthy-looking skin in both men and women. Common treatment intervals are every 4-6 weeks.

CONTRAINDICATIONS

Pregnant patients • Skin cancer

POST TREATMENT CARE

• Post care includes chilled gel packs and gentle moisturizers, and sunblock • Bruising, redness, and swelling are common and resolve with time. • Avoid heat (hot tubs, saunas, etc.) for 1-2 days and avoid skin irritants (i.e., products containing tretinoin, retinol, benzoyl peroxide, glycolic/salicylic acids, astringents, etc.) • Contact us if blistering, excessive redness/swelling develop. • Common treatment intervals are every 4-6 weeks.

Fees*

- Cheeks for facial erythema (1/series of 3) \$450/1250
- Full face erythema \$550/1400
- LaserGenesis face/neck/chest \$450/250/400
- Vessels start at \$250

*Prices do not include HST
