

Fraxel Dual™

What is it?

This is a laser treatment to achieve smoother, fresher, younger-looking skin; improve tone and texture; reduce brown spots; reduce fine lines and wrinkles; pre-cancer spots and improve appearance of acne scars and surgical scars.

This laser creates laser micro columns that penetrate the skin. These areas of microscopic damage result in skin remodeling with an increase in collagen and elastic tissue; resurfacing your skin by stimulating the growth of new healthy tissue from the inside out. As only a fraction of skin is treated at any one-time, rapid healing takes place as the surrounding tissue is left intact.

What can I expect?

A skin numbing cream is applied after skin cleansing and preparation. Cold air is applied onto the skin throughout the process to minimize discomfort. Patients describe an increased sensation of heat during treatment. The procedure takes approximately 20 minutes for a full face treatment.

What can I expect after?

Immediately afterwards, there is slight skin redness and the sensation of a mild sunburn. Skin care products will be reviewed along with high level sun protection. Small micro crusts may form within a few days which will slough off with continued moisturization.

How many treatments will I need?

On average, an effective treatment regimen is 3 to 5 sessions spaced approximately 3 or 4 weeks apart. Results are immediate and progressive with optimal improvement seen at 2-3 months.

Fees*

- One site (face, neck or V upper chest): \$800
- Two or more sites (on one session): \$700 / ea site

*Prices do not include HST
